Exploiting With Discover ..... 5-19

POC ..... 20-43

# Introduction to Tesla company

In August 2015, two researchers said they were able to take control of a Tesla Model S by hacking into the car's entertainment system. The hack required the researchers to physically access the car. Tesla issued a security update for the Model S the day after the exploit was announced.

In September 2016, researchers at Tencent's Keen Security Lab demonstrated a remote attack on a Tesla Model S and controlled the vehicle in both Parking and Driving Mode without physical access. They were able to compromise the automotive networking bus (CAN bus) when the vehicle's web browser was used while the vehicle was connected to a malicious Wi-Fi hotspot. This was the first case of a remote control exploit demonstrated on a Tesla. The vulnerability was disclosed to Tesla under their bug bounty program and patched within 10 days, before the exploit was made public. Tencent also hacked the doors of a Model X in 2017.

In January 2018, security researchers informed Tesla that an Amazon Web Services account of theirs could be accessed directly from the Internet and that the account had been exploited for cryptocurrency mining. Tesla responded by securing the compromised system, rewarding the security researchers financially via their bug bounty program, and stating that the compromise did not violate customer privacy, nor vehicle safety or security. Later in 2019, Tesla awarded a car and \$375,000 to ethical hackers during a Pwn2Own Model 3 hacking event.

# Introduction to Discover Tool

Discovery is the tool that automatically discovers devices in your network. You supply the discovery tool with a range or list of IP addresses, and the discovery tool determines if a device exists at each IP address. For each device the discovery tool "discovers", the discovery tool can collect a list of open ports, DNS information, SSL certificates, a list of network interfaces, device classes to align with the device, and basic SNMP information about the device. The discovery tool also determines which (if any) Dynamic Applications to align with the device. If the discovery tool finds Dynamic Applications to align with the device, the discovery tool triggers collection from the device, using each aligned Dynamic Application.

The screenshot shows the GitHub repository page for **leebaird/discover**. The repository is public and has 763 forks and 2.7k stars. The main content area displays a list of files and folders with their commit messages and timestamps:

File/Folder	Commit Message	Timestamp
config	Added another Python web server alias.	last month
misc	House cleaning.	2 months ago
mods	House cleaning.	2 months ago
notes	Tweaked Linux notes.	3 hours ago
parsers	House cleaning.	2 months ago
report	Move registered domains to a new menu option under recon.	yesterday
resource	Cleanup whois and remove some recon-ng modules.	8 days ago
.gitignore	port parse burp script to py3	9 months ago
LICENSE	Updated LICENSE date.	5 years ago

The sidebar on the right contains the following information:

- About:** Custom bash scripts used to automate various penetration testing tasks including recon, scanning, enumeration, and creating malicious payloads using Metasploit. For use with Kali Linux.
- Tags:** bash, osint, nmap, penetration-testing, recon, scanning, kali-linux, red-team, information-gathering, metasploit, payload-generator, reconnaissance.
- Readme:** MIT license
- Stars:** 2.7k stars
- Watching:** 199 watching
- Forks:** 763 forks

In the above picture it is the screenshot of tool Discover. It is located in the Github site the link is given below I have already downloaded the tool in my pc so let's begin with the tool .

<https://github.com/leebaird/discover.git>

# Exploiting With Discover

```
Applications Places Terminal
DISCOVER
By Lee Baird

RECON
1. Domain
2. Person

SCANNING
3. Generate target list
4. CIDR
5. List
6. IP, range, or URL
7. Rerun Nmap scripts and MSF aux

WEB
8. Insecure direct object reference
9. Open multiple tabs in Firefox
10. Nikto
11. SSL

MISC
12. Parse XML
13. Generate a malicious payload
14. Start a Metasploit listener
15. Update
16. Exit

Choice: 
```

In the above picture I have entered the tool by typing “ **bash discover.sh** “

```
Applications Places Terminal
Discover
By Lee Baird
RECON
1. Passive
2. Active
3. Import names into an existing recon-ng workspace
4. Previous menu
Choice: 1
```

I have gone to Domain by typing 1 and gone to Recon and again choose the passive by typing 1.

```
Applications Places Terminal
Discover
By Lee Baird
Uses Amass, ARIN, DNSRecon, dnstwist, goog-mail, goohost, theHarvester,
Metasploit, Whois, multiple websites, and recon-ng.
[*] Acquire API keys for maximum results with theHarvester and recon-ng.
=====
Usage
Company: Target
Domain: target.com
=====
Company: tesla
Domain: tesla.com
```

Now,I have added the company name and company domain and hit enter. Now the tool will search all the result from **search engines**, **Recon-ng** tool and **TheaHarvester** tool and gives the results to us Let's see the result.

```
Applications  Places  Terminal  Jul 19 9:32 AM
kali@kali: ~/Desktop/d
[*] Version check disabled.
Sponsored by...
BLACK HILLS
www.blackhillinfosec.com
PRACTISEC
www.practisec.com
[recon-ng v5.1.2, Tim Tomes (@lanmaster53)]
[97] Recon modules
[8] Reporting modules
[4] Import modules
[2] Exploitation modules
[2] Discovery modules
[1] Disabled modules
[recon-ng][default] > marketplace refresh
[*] Marketplace index refreshed.
[recon-ng][default] > marketplace install all
[*] Module installed: discovery/info_disclosure/cache_snoop
[*] Module installed: discovery/info_disclosure/interesting_files
```

Now The tool is again serching from Recon-ng Tool and giving the information.

```
Applications  Places  Terminal  Jul 19  2:14 PM
root@kali: /home/kali/Desktop/discover

root@kali: /home/kali/Desktop/discover x  kali@kali: ~/Desktop/discover x  kali@kali: ~/
